

Lec 06 - Forms And Input In Elm

CS 1XA3

Feb 13, 2018

Review: Basic Elm App Template

```
type alias Model = ...  
type Msg = ...
```

```
init : Model  
init = ...
```

```
update : Msg -> Model -> Model  
update msg model = ...
```

```
view : Model ->Html Msg  
view model = ...
```

```
main : Program Never Model Msg  
main = beginnerProgram  
      { model = init, view = view, update = update }
```

- ▶ An Html tag for button is defined in [Html](#)

```
button : List (Attribute msg) -> List (Html msg)
      -> Html msg
```

- ▶ Attributes of a button should include an event from [Html.Event](#)

Example

```
main = div []
      [button [onClick Msg] [text "Label"]]
```

Elm Mouse Events

Mouse events are defined in `Html.Event`

```
onClick : msg -> Attribute msg
```

```
onDoubleClick : msg -> Attribute msg
```

```
onMouseDown : msg -> Attribute msg
```

```
onMouseUp : msg -> Attribute msg
```

```
onMouseOver : msg -> Attribute msg
```

```
onMouseOut : msg -> Attribute msg
```

Case Study: Pic Selector

- ▶ Consider the following model

```
type alias Model = { imgs : List String }
```

```
init : Model
```

```
init = { imgs = ["Img1.jpg", "Img2.jpg", "Img3.jpg"] }
```

```
getImage model = ...
```

```
rotateRight model = ...
```

```
rotateLeft model = ...
```

- ▶ We can use this functionality to build a **Pic Selector**

Other Input Methods: RadioButtons

Example

```
view model = fieldset [] [radio "Image1" Image1,  
                           radio "Image2" Image2,  
                           radio "Image3" Image3 ]
```

```
radio : String -> msg -> Html msg  
radio value msg =  
  label  
    [ style [("padding", "20px")] ]  
    [ input [ type_ "radio", name "font-size",  
              onClick msg ] []  
      , text value  
    ]
```

See [https:](https://www.w3schools.com/html/html_form_input_types.asp)

[//www.w3schools.com/html/html_form_input_types.asp](https://www.w3schools.com/html/html_form_input_types.asp) for
a reference on different **input** types

Other Input Methods: Text Fields

Create a textfield using the `input` Html tag and update the model with the `onInput` Html event

```
type Msg = Content String
view model =
    input [ placeholder "Place", onInput Content ] []
```
