Last Day Antiderivatives

$F(x)$ is an antiderivative of $f(x)$ if $F'(x) = f(x)$

eg. $\frac{d}{dx} x = 1 \Rightarrow$ x is an antiderivative of 1

$$\frac{d}{dx} x^2 = 2x$$

$$\frac{d}{dx} x^2 + 10 = 2x$$

$$\frac{d}{dx} (x^2 + 59^{59}) = 2x$$

$$\frac{d}{dx} (x^2 + C) = 2x$$

If $F(x)$ is an antiderivative of $f(x)$

then any $F(x) + C$ is also an antiderivative
of $f(x)$

(for all real constant C)

Notice Say $F(x)$ & $G(x)$ are both antiderivs of $f(x)$

$$\Rightarrow F'(x) = f(x) = G'(x)$$

$$\Rightarrow F'(x) - G'(x) = 0 = \frac{d}{dx} (F(x) - G(x))$$

always!

but by MVT on any interval $[a, b]$

if F, G are cont. & diff \Rightarrow ~~$F(x) - G(x)$~~ diff is
constantly zero!

Why? Let $\Delta = F - G$

$$\frac{\Delta(b) - \Delta(a)}{b - a} = \Delta'(c) = 0$$

MVT

$$\Delta(b) - \Delta(a) = 0 \Rightarrow \Delta(b) = \Delta(a) = \underline{\underline{\text{const}}}$$

$$\Rightarrow \underline{\underline{F(x) - G(x) = \Delta(x) = \underline{\underline{C}}}}$$

\Rightarrow Punchline or TL:DR

If $F(x)$ & $G(x)$ are both antiderivatives of $f(x)$

$$\Rightarrow F(x) - G(x) = \text{const.}$$

So we can define: General Antideriv of $f(x)$

Notation If $F'(x) = f(x)$ (i.e. F is any ant-der of $f(x)$)

then general antidoubling

$$\int f(x) dx = F(x) + C$$

aka. "The Indefinite Integral"

eg. $\int 1 dx = x + C$ } \leftarrow arbitrary constant!
family of antiderivatives!

$$\int \sin x \, dx = -\cos x + C$$

$$\int \sec^2 x dx = \tan x + C$$

$$\int \frac{1}{1+x^2} dx = \tan^{-1}(x) + C$$

$$\int x dx = \frac{x^2}{2} + C \quad \left\{ \begin{aligned} &\leftarrow \frac{1}{2} \frac{d}{dx} x^2 = \frac{2x}{2} \\ &\frac{d}{dx} \frac{x^2}{2} = x \end{aligned} \right.$$

become $\frac{1}{2} = \text{const. mult.}$!

$$\int x^2 dx = \frac{x^3}{3} + C$$

$$\int x^5 dx = \frac{x^6}{6} + C$$

$$\boxed{\int x^p dx = \frac{x^{p+1}}{p+1} + C \quad p \neq -1}$$

Power Rule
of Integration

$$\int x^{101} dx = \frac{x^{102}}{102} + C$$

$$\int \sqrt{x} dx = \frac{x^{\frac{1}{2}+1}}{1+\frac{1}{2}} + C = \frac{2}{3} x^{3/2} + C$$

$$\int \frac{1}{x} dx = \int x^{-1} dx \quad \frac{d}{dx} ? = \frac{1}{x}$$

$$\underline{\underline{x > 0}} \quad = \ln x + C, \underline{\underline{x > 0}} \quad ? = \ln x$$

$$\int \frac{1}{\text{mower}} d\text{mower} = \ln(\text{mower}) + C$$

(mower > 0)

What about -ve x's?

$$\frac{d}{dx} \ln x = \frac{1}{x}$$

$$\frac{d}{dx} \ln(kx) = \frac{1}{kx} \cdot k = \frac{1}{x}$$

$$\ln x + \underline{\underline{\ln k}}$$

$$\frac{d}{dx} \ln(-x) = \frac{1}{(-x)} (-1) = \frac{1}{x}$$

domain: $x < 0$ only!

so

$$\frac{d}{dx} \ln x = \frac{1}{x}, x > 0$$

$$\frac{d}{dx} \ln(-x) = \frac{1}{x}, x < 0$$

so

$$\frac{d}{dx} \ln|x| = \frac{1}{x} \quad \text{all } x \neq 0$$

$$\Rightarrow \int \frac{1}{x} dx = \ln|x| + C \quad \text{all } \underline{x \neq 0}$$

Integration Laws: If $\int f(x) dx = F(x) + C$, $\int g(x) dx = G(x) + C$

$$\begin{aligned} 1) \quad \int f(x) \pm g(x) dx &= \int f(x) dx \pm \int g(x) dx \\ &= (F(x) + C_1) \pm (G(x) + C_2) \\ &= \underline{\underline{F(x) + G(x) + C}} \end{aligned}$$

$$\begin{aligned} 2) \quad \int k f(x) dx, \quad k \in \mathbb{R} \\ &= k \int f(x) dx = k (F(x) + C) \\ &= k F(x) + C \\ &\quad \uparrow \\ &\quad \text{arbitrary } C \end{aligned}$$

eg. $\int 7x^3 + 2x - \cosh x \, dx$

$$\begin{aligned}
 &= \int 7x^3 \, dx + \int 2x \, dx - \int \cosh x \, dx \\
 &= 7 \int x^3 \, dx + 2 \int x \, dx - \int \cosh x \, dx \\
 &= 7 \cdot \left(\frac{x^4}{4} \right) + 2 \left(\frac{x^2}{2} \right) - \sinh(x) + C \\
 &= \left(\frac{7}{4} \right) x^4 + x^2 - \sinh(x) + C
 \end{aligned}$$

eg. $\int \frac{\sqrt{x} + x^9 + 4}{x} \, dx$ } Quotient, Eur!
 kill with fire!
 (Divide!)

$$= \int \frac{x^{1/2} + x^9 + 4}{x} \, dx$$

$$= \int x^{-\frac{1}{2}} + x^9 + 4 \cdot \frac{1}{x} dx$$

$$= \frac{x^{1/2}}{(1/2)} + \frac{x^9}{9} + 4 \ln|x| + C$$

$$= 2\sqrt{x} + \frac{1}{9}x^9 + \ln(x^4) + C$$

eg. $\int 10^x dx$

$= \frac{10^x}{\ln 10} + C$

$\Rightarrow \frac{d}{dx} 10^x = 10^x \cdot \ln 10$

$\Rightarrow \left(\frac{1}{\ln 10} \right) \frac{d}{dx} 10^x = 10^x$

$\Rightarrow \frac{d}{dx} \left(\frac{10^x}{\ln 10} \right) = 10^x$

constant

$\int 2x e^{x^2} dx$ } notice $\frac{d}{dx} e^{x^2} = 2x e^{x^2}$
 $= \underline{\underline{e^{x^2} + C}}$

We'll reverse chain & product not week

Today Let's talk

App: "Initial Value Problem"
(IVP)

eg

$$a = g = 10 \text{ m/s}^2$$

$$v(0) = 0 \text{ (given)}$$

find his velocity at time t

Solution

$$a = 10 = v' \leadsto$$

$$v = \int a dt \quad \swarrow a = \underline{\underline{\text{const}}}$$
$$= a \int 1 dt$$

but I.C.

$$v(0) = 0$$

$$\left\{ \begin{aligned} v &= at + c \\ &= 10t + c \end{aligned} \right.$$

$$v(0) = 0 = 10(0) + \underline{c} \leadsto \underline{\underline{c = 0}}$$

Our particular solution for our initial condition

$$\text{is } \boxed{v(t) = 10t}$$

Part b) If at $t=0$, $p(0) = 0 = \text{pos.h.}$

find p(t)

Solution

$$p'(t) = v(t) = 10t$$

$$p = \int 10t \, dt = 10 \cdot \underline{\underline{\frac{1}{2}t^2 + C}}$$

$$\text{If } p(0) = 0 \leadsto$$

$$0 = \cancel{5t^2} + C \leadsto \underline{\underline{C = 0}}$$

$$\boxed{p(t) = 5t^2}$$
