

**Functions** Modify parameter settings for this resourceCAPA 9

What is the pressure 147m beneath the surface of the ocean? Take the density of sea water to be  $1.06 \times 10^3 \text{ kg/m}^3$  and the atmospheric pressure at sea level to be 101kPa.

Submit Answer Tries 0/10

An iron block appears to be 212N lighter in water than in air. Find the volume of the block.

Submit Answer Tries 0/10

How much does the block weigh in air (assume that the density of iron is  $7870 \text{ kg/m}^3$ )?

Submit Answer Tries 0/10

A 42.1cm thick layer of oil (density  $900.0 \text{ kg/m}^3$ ) floats on a 139.2cm thick layer of water. What is the absolute pressure at the bottom of the water layer?

Submit Answer Tries 0/10

The four tires of an automobile are inflated to a gauge pressure of 180.3 kPa. Each tire has an area of  $0.0400 \text{ m}^2$  in contact with the ground. Determine the weight of the automobile.

Submit Answer Tries 0/10

The spring of a pressure gauge has a force constant of  $845 \text{ N/m}$ , and the piston attached has a diameter of 1.88cm. When the gauge is lowered into water, at what depth does the piston move in by 0.562cm from its position at the surface?

Submit Answer Tries 0/10

What is the height of a barometer composed of a fluid with a density of  $811.0 \text{ kg/m}^3$  at atmospheric pressure?

Submit Answer Tries 0/10

What volume of water has the same mass as  $4.15 \text{ m}^3$  of ethyl alcohol, if the density of ethyl alcohol is  $790.0 \text{ kg/m}^3$ ?

Submit Answer Tries 0/10

If this volume of water is in a cubic tank, what is the pressure at the bottom?

Submit Answer Tries 0/10

A rectangular window in a house has dimensions  $3.10 \text{ m} \times 1.80 \text{ m}$ . As a storm passes by, the air pressure outside drops to  $0.928 \text{ atm}$  while the pressure inside the house remains  $1.00 \text{ atm}$ . What is the magnitude of the net force pushing on the window? Take atmospheric pressure to be  $101 \text{ kPa}$

Submit Answer Tries 0/10

Apple juice has a density of  $1053 \text{ kg/m}^3$ . In order to suck some juice up a straw to a height of  $3.65 \text{ cm}$ , what minimum gauge pressure must be produced in a person's lungs?

Submit Answer Tries 0/10

A shot (a spherical object thrown in 'shot put') hangs from a spring balance. The balance registers that in air the shot weighs  $28.0 \text{ N}$  and that in water it weighs  $18.7 \text{ N}$ . When the shot is submerged in a mystery fluid, it weighs  $25.4 \text{ N}$ . What is the density of the mystery fluid?

Submit Answer Tries 0/10

An object hangs from a spring balance. The balance registers  $38.7 \text{ N}$  in air,  $21.4 \text{ N}$  when this object is immersed in water, and  $27.2 \text{ N}$  when the object is immersed in another liquid of unknown density. What is

the density of that other liquid.

Submit Answer Tries 0/10

Blaise Pascal duplicated Torricelli's barometer using a red Bordeaux wine of density  $955.1 \text{ kg/m}^3$ , as the working liquid. What is the height of a wine column in a barometer for normal atmospheric pressure?

Submit Answer Tries 0/10

Calculate the absolute pressure at an ocean depth of 998m. Assume the density of seawater is  $1024 \text{ kg/m}^3$

Submit Answer Tries 0/10

At this depth, what force must the frame around a circular submarine porthole having a diameter of 85.7cm exert to counter balance the force exerted by the water?

Submit Answer Tries 0/10

A styrofoam slab has a thickness of 17.9cm and a density of  $543 \text{ kg/m}^3$ . When a 45.1kg is resting on it, the slab floats in fresh water with its top at the same level as the water's surface. Find the area of the slab.

## Assignment 9

1.  $p_{\text{tot}} = p_{\text{air}} + p_{\text{water}}$

$$\begin{aligned} p_{\text{water}} &= \rho \cdot g \cdot h \\ &= (1.06 \times 10^3 \text{ kg/m}^3)(9.8 \text{ m/s}^2)(147 \text{ m}) \\ &= 1527 \text{ kPa} \end{aligned}$$

$$\begin{aligned} p_{\text{tot}} &= 101 \text{ kPa} + 1527 \text{ kPa} \\ &= 1628 \text{ kPa} \end{aligned}$$

2. a) 212 N lighter in water  $\rightarrow$  212 N buoyancy force.  
how much mass is the mass of the water causing this force?

$$\begin{aligned} 212 \text{ N} &= m a \\ m &= \frac{212 \text{ N}}{9.8 \text{ m/s}^2} \\ &= 21.6 \text{ kg} \end{aligned}$$

$$\begin{aligned} V &= \frac{m}{\rho} \\ &= \frac{21.6 \text{ kg}}{1000 \text{ kg/m}^3} \\ &= 0.0216 \text{ m}^3 \end{aligned}$$

which is equal to the volume of the iron block.

$$\begin{aligned} \text{b) } m &= \rho V \\ &= (7870 \text{ kg/m}^3)(0.0216 \text{ m}^3) \\ &= 170.0 \text{ kg} \end{aligned}$$

$$\begin{aligned} F &= m a \\ &= (170.0 \text{ kg})(9.8 \text{ m/s}^2) \\ &= 1666.0 \text{ N} \end{aligned}$$

$$3. P_{\text{tot}} = P_{\text{air}} + P_{\text{oil}} + P_{\text{water}}$$

$$P_{\text{air}} = 101 \text{ kPa}$$

$$P_{\text{oil}} = \rho g h$$

$$= (900 \text{ kg/m}^3)(9.8 \text{ m/s}^2)(0.421 \text{ m})$$

$$= 3713.7 \text{ Pa}$$

$$P_{\text{water}} = (1000 \text{ kg/m}^3)(9.8 \text{ m/s}^2)(1.392 \text{ m})$$

$$= 13641.6 \text{ Pa}$$

$$P_{\text{tot}} = 101 \text{ kPa} + 3.71 \text{ kPa} + 13.64 \text{ kPa}$$

$$= 118.4 \text{ kPa}$$

$$4. p = \frac{F}{A}$$

$$A = 4 \cdot 0.0400 \text{ m}^2$$

$$= 0.16 \text{ m}^2$$

$$F = p \cdot A$$

$$= (180.3 \text{ kPa})(0.16 \text{ m}^2)$$

$$= 28.8 \text{ kN}$$

$$5. k = 845 \text{ N/m} \quad r = 0.0188 \text{ m} \quad x = 0.00562 \text{ m}$$

$$A = \pi \left(\frac{d}{2}\right)^2$$

$$= \pi (0.0188/2)^2$$

$$= 0.00028 \text{ m}^2$$

$$p = \frac{F}{A} = \rho \cdot g h$$

$$F = kx$$

$$= (845 \text{ N/m})(0.00562 \text{ m})$$

$$\rho g h = \frac{F}{A}$$

$$h = \frac{F}{\rho g \cdot A}$$

$$= \frac{(845 \text{ N/m})(0.00562 \text{ m})}{(1000 \text{ kg/m}^3)(9.8 \text{ m/s}^2)(0.0011 \text{ m}^2)}$$

$$= 1.75 \text{ m}$$

$$6. p = \rho \cdot g \cdot h$$

$$h = \frac{p}{\rho \cdot g}$$

$$= \frac{101.3 \text{ kPa}}{}$$

$$\frac{(811.0 \text{ kg/m}^3)(9.8 \text{ m/s}^2)}{}$$

$$= 12.75 \text{ m}$$

$$7. a) m = \rho \cdot V$$

$$= (790.0 \text{ kg/m}^3)(4.15 \text{ m}^3)$$

$$= 3278.5 \text{ kg}$$

$$V = \frac{m}{\rho}$$

$$= \frac{3278.5 \text{ kg}}{1000 \text{ kg/m}^3}$$

$$= 3.28 \text{ m}^3$$

$$b) \text{ cubic tank: } V = h \times h \times h$$

$$\sqrt[3]{V} = h$$

$$p = \rho \cdot g \cdot h$$

$$= \rho \cdot g \cdot \sqrt[3]{V}$$

$$= (1000 \text{ kg/m}^3)(9.8 \text{ m/s}^2)(\sqrt[3]{3.28 \text{ m}^3})$$

$$= 14.6 \text{ kPa}$$

$$p_{\text{tot}} = 101 \text{ kPa} + 14.6 \text{ kPa}$$

$$= 116.0 \text{ kPa}$$

$$8. \Delta p = 1.00 \text{ atm} - 0.928 \text{ atm} \\ = 0.072 \text{ atm} \cdot \frac{101.3 \text{ kPa}}{1 \text{ atm}}$$

$$= 7.29 \text{ kPa}$$

$$p = \frac{F}{a}$$

$$F = p \cdot a$$

$$= (7.28 \text{ kPa})(3.1 \text{ m} \cdot 1.80 \text{ m})$$

$$= 40.7 \text{ kN}$$

$$9. p = -\rho \cdot g \cdot h$$

$$= -(1053 \text{ kg/m}^3)(9.8 \text{ m/s}^2)(0.0365 \text{ m})$$

$$= -376.7 \text{ Pa}$$

$$10. \Delta \text{ weight in water: } \cancel{28.4 \text{ N}} - 28.0 \text{ N} = 18.7 \text{ N}$$

$$F_w = 9.3 \text{ N}$$

$$\Delta \text{ weight in fluid: } 28.0 \text{ N} - 25.4 \text{ N}$$

$$F_f = 2.6 \text{ N}$$

shot displaces same volume in both

$$V = \frac{m}{\rho} = \frac{F \cdot a}{\rho}$$

$$\frac{F_w \cdot a}{\rho_w} = \frac{F_f \cdot a}{\rho_f}$$

$$\rho_f = \frac{F_f}{F_w} \cdot \rho_w$$

$$= \frac{2.6 \text{ N}}{9.3 \text{ N}} \cdot 1000 \text{ kg/m}^3 = 279.6 \text{ kg/m}^3$$

11. Same as 10:

$$\begin{aligned}
 \rho_f &= \frac{\Delta \text{weight}_f}{\Delta \text{weight}_w} \cdot \rho_w \\
 &= \frac{(38.7 \text{ N} - 27.2 \text{ N})}{(38.7 \text{ N} - 21.4 \text{ N})} \cdot 1000 \text{ kg} \cdot \text{m}^3 \\
 &= 664.7 \text{ kg/m}^3
 \end{aligned}$$

12.  $p = \rho \cdot g \cdot h$

$$\begin{aligned}
 h &= \frac{p}{\rho \cdot g} \\
 &= \frac{101.3 \text{ kPa}}{(955.1 \text{ kg/m}^3)(9.8 \text{ m/s}^2)} \\
 &= 10.8 \text{ m}
 \end{aligned}$$

13. a)  $p_{\text{water}} = \rho \cdot g \cdot h$

$$\begin{aligned}
 &= (1024 \text{ kg/m}^3)(9.8 \text{ m/s}^2)(998 \text{ m}) \\
 &= 10015.1 \text{ kPa}
 \end{aligned}$$

$$\begin{aligned}
 p_{\text{tot}} &= p_{\text{air}} + p_{\text{water}} \\
 &= 101.3 \text{ kPa} + 10015.1 \text{ kPa} \\
 &= 10116 \text{ kPa}
 \end{aligned}$$

b)  $a = \pi \left(\frac{d}{2}\right)^2$

$$\begin{aligned}
 &= \pi (0.857 \text{ m}/2)^2 \\
 &= 0.58 \text{ m}^2
 \end{aligned}$$

$$\begin{aligned}
 F &= p \cdot a \\
 &= (10116 \text{ kPa})(0.58 \text{ m}^2) \\
 &= \cancel{5.9} \quad 5.9 \times 10^6 \text{ N}
 \end{aligned}$$

$$14. m_{tot} = m_{obj} + m_{styro}$$

$$m_{styro} = A \cdot h \cdot \rho_s$$

$$\rightarrow \begin{cases} m = V \cdot \rho \\ V = A \cdot h \end{cases}$$

$$F = m_{tot} g$$

$$= g(m_{obj} + A \cdot h \cdot \rho_s)$$

This is equal to the buoyant force,  
which is:

$$F = m_{water} \cdot a$$

$$= g(m_{water})$$

$$\text{so: } = g(A \cdot h \cdot \rho_w)$$

$$g(m_{obj} + A \cdot h \cdot \rho_s) = g(A \cdot h \cdot \rho_w)$$

$$A = \frac{m}{h(\rho_w - \rho_s)}$$

$$= \frac{45.1 \text{ kg}}{}$$

$$(0.179 \text{ m})(1000 \text{ kg/m}^3 - 543 \text{ kg/m}^3)$$

$$= 0.55 \text{ m}^2$$
