

Because the concentration of $\text{Cu}^{2+}(\text{aq})$ is very small, we rounded this value to $2.5 \times 10^{-6} \text{ M}$.

⑥ Dilution of Cu^{2+} to $2.5 \times 10^{-6} \text{ M}$ from an original concentration of 0.05 M proceeds as follows.

a) solve for V_2 , if ~~0.5~~ 0.5 mL of $0.05 \text{ M Cu}^{2+}(\text{aq})$ must be diluted to $5 \times 10^{-4} \text{ M}$.

$$C_1 V_1 = C_2 V_2$$

$$(0.05 \text{ M})(0.5 \text{ mL}) = (5 \times 10^{-4} \text{ M})(V_2)$$

$$V_2 = 50 \text{ mL}$$

b) Next the $5 \times 10^{-4} \text{ M Cu}^{2+}(\text{aq})$ solution must be diluted further to $5 \times 10^{-6} \text{ M}$. Using 0.5 mL of this solution, the amount of water needed was calculated as follows:

$$C_1 V_1 = C_2 V_2$$

$$(5 \times 10^{-4} \text{ M})(0.5 \text{ mL}) = (5 \times 10^{-6} \text{ M})(V_2)$$

$$V_2 = 50 \text{ mL}$$

c) Now the $5 \times 10^{-6} \text{ M}$ solution must be diluted to the final concentration of $2.5 \times 10^{-6} \text{ M}$. Using 20 mL of the solution, the amount of water needed was calculated

as follows: call value from the TA and compare this value

$1 \text{ Cu}^{2+} \rightarrow 2 \text{ Zn}^{2+}$ potential values
 $(5 \times 10^{-4} \text{ M})(20 \text{ mL}) = (2.5 \times 10^{-6} \text{ M})(V_2)$
 $V_2 = 40 \text{ mL}$ potential that is the closest higher value

Thus the final concentration may be $1/40$ of the original $\text{Cu}^{2+}(\text{aq})$ round that

⑦ since the electrochemical cell is in a beaker, solution in a clean beaker.

⑧ "clean" Cu and Zn with battery paper and insert and connect electrodes in solution.

⑨ connect battery meter to solution to that voltage.

⑩ insert a.0.05 M Cu^{2+} and a.0.05 M Zn^{2+} and record the potential.

$$E_{\text{cell}} = E^{\circ} - (0.0592/2) \log Q$$

$$E_{\text{cell}} = E^{\circ} - (0.0592/2) \log \frac{[\text{Cu}^{2+}]}{[\text{Zn}^{2+}]}$$

$$\text{CALCULATION: } (0.0592/2) \log \frac{[\text{Cu}^{2+}]}{[\text{Zn}^{2+}]}$$

$$\text{PART ONE: } 0.0592$$

$$\% \text{ ERROR} = \frac{(\text{actual} - \text{theoretical})}{\text{theoretical}} \times 100$$

⑤. since the highest value of Zn^{2+} is 1.0 V - also $1.039 \text{ V} \times 100\%$

$$= \frac{[\text{Zn}^{2+}]}{[\text{Cu}^{2+}]} \times 100\%$$

for the concentration of Cu^{2+}

$$= -7.52\%$$

$$311545.9661 = 0.05 \text{ M}$$

PART TWO:

$$\% \text{ ERROR} = \frac{(\text{actual} - \text{theoretical})}{\text{theoretical}} \times 100\%$$
